

IRIS PONTICA ZAPAL. IN MOLDOVA'S FLORA (ROMANIA)

Irina IRIMIA¹, Ciprian MÂNZU¹

Abstract: The paper points out the presence of *Iris pontica* Zapal. in Moldova's territory (Romania), tracking at the same time the species distribution in Romania, using herbarium materials and existing bibliographic sources. The plant association in which *I. pontica* had been identified is Taraxaco serotinae – Festucetum valesiacae.

Keywords: *Iris pontica*, rare species, chorology, Moldova, SCI Movila lui Burcel.

Introduction

Iris pontica Zapal. (*Iris humilis* M. Bieb., non Georgi) is a perennial (geophyte), with a simple stem, 1-4 cm long (without the flower). Basal leaves 10-45 cm x 2-5 mm. Membranaceous spathes. Flowers solitary, purplish, variegated with white, yellow, or brown. Falls 45-55 x 15-18 mm; limb obovate-orbicular; claw spatulate, as wide as the limb. Standards 35-50 x 8-12 mm, oblanceolate. The upper portion of the ovary, sterile, forming a rostrum 18-25 mm long. Ellipsoidal capsule, with six inconspicuous longitudinal ridges (Webb and Chater, 1980).

It is a heliophytic species, xeromezophytic, growing on dry neutral soils, on sunny meadows from the oak floor to the sessile oak floor (Dihoru and Negrean, 2009; Ciocârlan, 2009; Sârbu et al., 2013).

I. pontica is a Pontic, continental element, the geographical area of this species spreading from Transylvania (Romania) to Central and South-Western Asia (Webb and Chatter, 1980; Dihoru and Negrean, 2009). It is mentioned on the Moldova Republic's territory (Webb and Chatter, 1980; Negru et al., 2002 - as endangered species), Ukraine's territory (Webb and Chatter, 1980; Mosyakin and Feredonchuk, 1999 - as vulnerable species). It is also considered vulnerable in the South-Western Russia (Stavropol Territory - Shevchenko, 2002).

In Romania's flora, *I. pontica* is a rare species (Oprea, 2005; Ciocârlan, 2009), found in the Red list of superior plants from Romania (Oltean et al., 1994), placed in the rare and vulnerable zoological category (V/R) as well as in the Red book of vascular plants from Romania (Dihoru and Negrean, 2009), in the critically endangered category (CR).

On Romania's territory, *I. pontica* had been signaled only in Transylvania, in Bistrița-Năsăud, Cluj, Mureș and Sibiu counties (Oprea, 2005; Dihoru and Negrean, 2009).

From the phytocoenological point of view, it is a steppic species, typical of Festuco-Brometea Class, Festucetalia valesiacae Order (Sanda et al., 2003; Kryts'ka et al., 2009; Sârbu et al., 2013).

Materials and methods

The identification of the taxa has been done using the following papers: *Flora R.S.R.*, vol. XI; *Flora Europaea*, vol. 5; *Flora României*, vol. II (Beldie, 1977); *Flora ilustrată a României – Pteridophyta et Spermatophyta* (Ciocârlan, 2009); *Plante vasculare din România: determinator ilustrat de teren* (Sârbu et al., 2013).

In order to identify the vegetal association in which *I. pontica* is present, we used the central-european phytosociological school method (Cristea et al., 2004; Chifu et al., 2006).

The distribution of *I. pontica* species in Romania, had been made based on data from the herbarium collections (BUCA, CL, I, IASI) (Thiers, 2012) and also different bibliographical sources.

The collected material was registered and stored in „Alexandru Ioan Cuza” University’s Herbarium (I), from Iași.

Figure 1. *Iris pontica*

Results and discussions

The species had been identified in the botanical reservation Movila lui Burcel (Miclești commune, Vaslui county), in the upper hill area, at a altitude of 270-272 m, on the N-NW slope ($46^{\circ}50'52''N$, $27^{\circ}48'07''E$ – $46^{\circ}50'54''N$, $27^{\circ}48'07''E$), the population spreading on a small area (7 points). The species was first noticed in may 2005 and then reconfirmed in 2013 (Fig. 1). The area was previously studied, floristically and phytocoenologically (Dobrescu and Leocov, 1982; Blaj, 2003), but *I. pontica* was not recorded, maybe by confusion with *I. graminea* L. (*I. graminea*, *I. pumila* L., *I. aphylla* L. were described by Dobrescu and Leocov).

The Movila lui Burcel reservation had been declared a Site of Community Importance in Natura 2000 Network (**ROSCI0117**). The site preserves a rest of western-Pontic steppic meadow (Habitat 62C0* - Ponto-Sarmatic steppes), having a high conservation value (Mănoiu and Brânzan, 2013).

Phytocoenologically, *I. pontica* had been included in the Taraxaco serotinae-Festucetum valesiacae (Burduja et al. 1956, Răvărău et al. 1956) Sârbiu, Coldea et Chifu 1999 association (Table 1).

Conclusions

This is the first record of *Iris pontica* in Moldova (Romania), in Movila lui Burcel reservation. Also, after processing the herbarium materials, we recorded the species in Alba county (Transylvania).

As a result of our observations, we consider *Iris pontica* as a threatened species in this site, mainly because of the presence of *Elaeagnus angustifolia* and *Robinia pseudoacacia*, species cultivated for stabilizing the land.

Acknowledgements

We wish to thank to curators of BUCA, CL, IASI. Also, we are grateful to Dr. Mihai Pușcaș, for unpublished chorological datas.
